TITLE

SYNTHESIS OF N-[N-(3,3-DIMETHYLBUTYL)-L- α -ASPARTYL]-L-PHENYLALANINE 1-METHYL ESTER USING OXAZOLIDINONE DERIVATIVES

This application claims the benefit of U.S. Provisional Patent Application No. 60/205,694, filed May 19, 2000.

BACKGROUND OF THE INVENTION

Field of the Invention

5 This invention relates to the synthesis of N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester (neotame) using novel oxazolidinone derivatives. This method of producing neotame is an alternative to the conventional synthetic route for producing neotame
10 which uses aspartame as a starting material.

Related Background Art

15 N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester (neotame) is a high potency dipeptide sweetener (about 8000X sweeter than sucrose) that has the formula

Neotame

Neotame may be synthesized using a variety of synthetic methods. The chemical synthesis of neotame is disclosed in U.S. Patent No. 5,480,668, U.S. Patent No. 5,510,508, U.S. Patent No. 5,728,862, U.S. Patent No. 6,077,962 and WO 00/15656, the disclosure of each of which is incorporated by reference herein.

U.S. Patent Nos. 5,510,508 and 5,728,862 describe the synthesis of neotame by hydrogenation of a mixture of aspartame and 3,3-dimethylbutyraldehyde with a catalyst such as Pd on carbon. This synthesis is represented by the following equation.

3,3-Dimethylbutyraldehyde

Aspartame

Neotame

International Patent Publication No. WO 00/15656 describes the formation of neotame by hydrogenation of a mixture of 3,3-dimethylbutyraldehyde and Z-aspartame (N-benzyloxycarbonyl-L- α -aspartyl-L-phenylalanine-1-

methyl ester) in a methanolic solvent. U.S. Patent No. 6,077,962 describes the synthesis of neotame using a peptide coupling method of an activated derivative of N-(3,3-dimethylbutyl)-L-aspartic acid and L-phenylalanine or L-phenylalanine methyl ester.

The literature teaches regioselective methods for the formation of α -aspartyl peptide bonds, as opposed to β -aspartyl peptide bonds, in the synthesis of aspartame. One of these methods comprises the cyclocondensation of carbonyl compounds with N-protected aspartic acid as described in Chinese Patent CN 11748844 A. The resulting oxazolidinone derivative, having the structure

wherein PG is a protecting group, R¹ is H or R², R² is CX₃ and X is Cl, Br or F, has the α -aspartyl carbonyl as an ester and the β -aspartyl carbonyl as a carboxylic acid. Thus, only the α -aspartyl carbonyl is activated for peptide bond formation. The nitrogen protecting groups included Z, Boc, formyl and acetyl groups.

Other examples in the literature teach regioselective methods for the formation of α -aspartyl peptide bonds, as opposed to β -aspartyl peptide bonds. Such methods

comprise the cyclocondensation of carbonyl compounds with aspartic acid without nitrogen protection. In these cases, the nitrogen of the oxazolidinone derivative having the structure

is an amine and not part of an amide, as was the case where nitrogen was protected.

The treatment of neohexyl-L-aspartic acid with carbonyl compounds to form oxazolidinone derivatives useful in the selective preparation of neotame without the formation of the beta isomer is not described in the above-described art.

It would be desirable, however, to develop more efficient and cost-effective methods of preparing high purity neotame from readily available or readily obtainable materials.

SUMMARY OF THE INVENTION

The present invention relates to the synthesis of N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester via novel oxazolidinone derivatives.

pub Cl

According to the present inventive method, neotame is synthesized by reacting N-(3,3-dimethylbutyl)-L-aspartic acid and a carbonyl or activated carbonyl compound in a solvent for a time and at a temperature sufficient to produce an oxazolidinone derivative and by reacting the oxazolidinone derivative and phenylalanine or phenylalanine methyl ester in the solvent for a time and at a temperature sufficient to produce N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester.

DETAILED DESCRIPTION

The present invention relates to the regioselective formation of N-alkylated α -aspartyl amides via the use of carbonyl compounds, and particularly to the use of such regioselective processing to obtain oxazolidinone derivatives which can react with L-phenylalanine methyl ester in a solvent with or without acid and/or a catalyst to yield N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester (neotame) with the usual work-up. The present synthetic method is represented by the following reaction scheme:

wherein R¹ is H or R², R² is H or Ph or CX₃, X is H, Cl, Br or F, R³ and R⁴ taken together is =O, or R³ and R⁴ are the same and are OCH₃ or OC₂H₅

According to the present invention, neotame is synthesized by reacting N-(3,3-dimethylbutyl)-L-aspartic acid and a carbonyl or activated carbonyl compound in a first solvent for a time and at a temperature sufficient to produce an oxazolidinone derivative and by reacting the oxazolidinone derivative and phenylalanine or phenylalanine methyl ester in a second solvent for a time and at a temperature sufficient to produce N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester.

According to the first step of the present inventive method, an admixture of N-(3,3-dimethylbutyl)-L-aspartic acid and a carbonyl or activated carbonyl compound are reacted in a first solvent for a time and at a temperature sufficient to produce an oxazolidinone derivative.

Carbonyl compounds (aldehydes and ketones) of the formula $R^1R^2C=O$ or activated carbonyl compounds (acetals of aldehydes and ketones) of the formula $CR^1R^2R^3R^4$, wherein R^1 is H or R^2 , R^2 is H or Ph or CX_3 , X is H, Cl, Br or F, R^3 and R^4 taken together is $=O$, or R^3 and R^4 are the same and are OCH_3 or OC_2H_5 , are suitable for use in

the present invention. Ph is phenyl or substituted phenyl. Suitable carbonyl compounds include, without limitation, hexafluoroacetone, 1,1,1-trifluoroacetone, trichloroacetaldehyde, tribromoacetaldehyde, hexachloroacetone, formaldehyde, paraformaldehyde, benzaldehyde, substituted benzaldehydes and combinations thereof.

N-(3,3-dimethylbutyl)-L-aspartic acid is prepared as described in U.S. Patent No. 6,077,962, the disclosure of which is incorporated by reference herein. The carbonyl compounds are readily available starting materials. The N-(3,3-dimethylbutyl)-L-aspartic acid and the carbonyl or activated carbonyl compound are typically combined in a molar ratio ranging from about 1:1 to about 1:4.

The solvents suitable for use as the first solvent in the present invention are limited only by reactivity considerations; in other words, the solvent must not react with the oxazolidinone derivative, the phenylalanine nucleophile or the resulting product, thereby impeding or prohibiting the desired reaction. Suitable solvents include, without limitation, tetrahydrofuran, diethyl ether, t-butyl methyl ether, ethyl acetate, dioxane, toluene, butyl acetate, methyl acetate, dichloromethane, dimethylformamide, dimethylsulfoxide and combinations thereof.

Generally, the time sufficient to produce an oxazolidinone derivative ranges from about 1 to about 48 hours, preferably from about 2 to about 24 hours. Generally, the temperature sufficient to produce neotame according to the present invention ranges from about 20°C to about 150°C, preferably from about 22°C to about 70°C.

Atc²
5

In certain embodiments of the present invention, a catalyst may be present during the reaction of N-(3,3-dimethylbutyl)-L-aspartic acid and the carbonyl compound. Suitable catalysts include, without limitation, p-toluenesulfonate. In certain embodiments of the present invention, an acid may be present during the reaction of N-(3,3-dimethylbutyl)-L-aspartic acid and the carbonyl compound. Suitable acids include, without limitation, formic acid, acetic acid, p-toluene sulfonic acid, methane sulfonic acid, 10-camphorsulfonic acid and combinations thereof.

10

According to the second step of the present inventive method, an admixture of the oxazolidinone derivative and phenylalanine or L-phenylalanine methyl ester are reacted in a second solvent for a time and at a temperature sufficient to produce N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester.

15

L-phenylalanine methyl ester is a readily available starting material. Typically, the L-phenylalanine methyl ester is used in a molar ratio with the oxazolidinone derivative produced in the first step of the present invention ranging from about 1:1 to about 1:2.

20

Generally, the time sufficient to produce N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester ranges from about 1 to about 48 hours, preferably from about 12 to about 24 hours. Generally, the temperature sufficient to produce neotame according to the present invention ranges from about 0°C to about 50°C, preferably from about 22°C to about 40°C.

30

The solvents suitable for use as the second solvent in the present invention are limited only by reactivity

35

considerations; in other words, the solvent must not react with the oxazolidinone derivative, the phenylalanine nucleophile or the resulting product, thereby impeding or prohibiting the desired reaction.

5 Suitable solvents include, without limitation, tetrahydrofuran, diethyl ether, t-butyl methyl ether, ethyl acetate, dioxane, toluene, butyl acetate, methyl acetate, dichloromethane, dimethylformamide, dimethylsulfoxide and combinations thereof. In certain
10 embodiments of the present invention, the first solvent and the second solvent used in the first and second steps, respectively, are the same solvent.

The present invention may also include additional
15 steps. Such additional steps include, without limitation, solvent concentration adjustment, seeding, cooling (crystallization), and neotame isolation.

Typically crystallization of neotame is accomplished by
20 cooling the mixture to about 0-25°C, preferably to about 5-10°C, over the course of about 0.5-2 hours, preferably about 1-2 hours.

Seeding prior to or during crystallization can initiate
25 a controlled crystal growth rate according to the present invention. Hence, the reaction mixture may optionally be seeded in an amount from 0.0001%-10%, by weight of the N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester in the solution,
30 preferably from 0.1% to 1% and most preferably from 0.1% to 0.5%. Seeding is typically performed at 25-35°C and preferably at 28-30°C.

The reaction mixture may be unstirred or stirred while
35 neotame crystallizes according to the present invention.

Crystallized neotame may be separated from the solvent solution by a variety of solid-liquid separation techniques that utilize centrifugal force, that include, without limitation, vertical and horizontal perforated basket centrifuge, solid bowl centrifuge, decanter centrifuge, peeler type centrifuge, pusher type centrifuge, Heinkel type centrifuge, disc stack centrifuge and cyclone separation. Additionally, separation may be enhanced by any of pressure, vacuum, and gravity filtration methods, that include, without limitation, the use of belt, drum, nutsche type, leaf, plate, Rosenmund type, sparkler type, and bag filters and filter press. Operation of the neotame solid-liquid separation device may be continuous, semi-continuous or in batch mode. The neotame solid may also be washed on the separation device using various liquid solvents, including, without limitation, water, methanol and mixtures thereof. The neotame solid can also be partially and totally dried on the separation device using any number of gases, including, without limitation, nitrogen and air, to evaporate residual liquid solvent. The neotame solid may be automatically or manually removed from the separation device using liquids, gases or mechanical means by either dissolving the solid or maintaining the solid form.

The neotame synthesized according to the present invention may be purified by any known method including, but not limited to, the following methods. U.S. Patent No. 5,728,862 outlines a purification method by which neotame is precipitated out of an aqueous/organic solvent solution, wherein the aqueous/organic solvent solution has an amount of organic solvent of about 17% to about 30% by weight. Copending U.S. Patent Application Serial No. 09/448,671, filed on November 24, 1999, relates to methods of purifying neotame by crystallization in a

variety of organic solvent/aqueous organic solvent mixtures; each of these methods involves the use of an organic solvent and water mixture and solvent distillation. Copending U.S. Patent Application Serial No. 09/449,314, filed on November 24, 1999, relates to methods of purifying neotame using chromatography.

The neotame synthesized according to the present invention is the monohydrate, which may be dried to produce an anhydrous form.

The crystallized and isolated neotame solid may be further purified by a variety of drying methods. Such methods are known to those skilled in the art and include, but are not limited to, the use of a rotary vacuum dryer, fluid bed dryer, rotary tunnel dryer, plate dryer, tray dryer, Nauta type dryer, spray dryer, flash dryer, micron dryer, pan dryer, high and low speed paddle dryer and microwave dryer.

The Examples which follow are intended as an illustration of certain preferred embodiments of the invention, and no limitation of the invention is implied.

EXAMPLE 1

4-Carbomethoxy-3-N-(3,3-dimethylbutyl)-2,2-bis(trifluoro-methyl)oxazolidin-5-one

A gas flow of hexafluoroacetone is blown at a moderate rate at room temperature onto an intensely stirred suspension of 100 mmol of N-(3,3-dimethylbutyl)-L-aspartic acid in 40 ml anhydrous dimethylsulfoxide. The absorption of the gas starts after a short induction period. The gas flow is adjusted in a way that an excess of hexafluoroacetone is always present

5

0

dimethylsulfoxide and hexafluoroacetone hydrate, the combined solutions of ethyl acetate are washed three times with 50 ml ice water and dried over anhydrous sodium sulfate. After removal of the solvent under reduced pressure, the compounds crystallize out.

EXAMPLE 2

N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine
1-methyl ester

5 To a solution of 20 mmol of 4-carbomethoxy-3-N-(3,3-
dimethylbutyl)-2,2-bis(trifluoromethyl)oxazolidin-5-one
in 50 ml anhydrous diethyl ether, a solution of 4.25 g
(24 mmol) L-phenylalanine methyl ester in 5 ml
10 anhydrous diethyl ether is added dropwise with stirring
at room temperature. A crystalline solid substance
begins to precipitate within a few minutes. The
reaction finishes within 24 hours.

EXAMPLE 3

15 4-Carbomethoxy-3-N-(3,3-dimethylbutyl)-2-(trichloro-
methyl)oxazolidin-5-one

To a 250 ml round bottom flask was added 10 mmol N-3,3-
dimethylbutyl-L-aspartic acid and 20 mmol of
20 tribromoacetaldehyde in dichloromethane (150 ml) in the
presence of pyridinium p-toluenesulfonate (100 mg).
The mixture was refluxed for 24 hours to yield a light
yellow solution. The solvents were removed at <50°C
with vacuum. The oily residue was dissolved in 30 ml
25 dichloromethane, and the solution was cooled to -10°C
for crystallization. The crystals were isolated,
washed with pet ether and dried. Yield 50%.

EXAMPLE 4

30 N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine
1-methyl ester

To a 100 ml 3-necked flask was loaded 4-carbomethoxy-3-
N-(3,3-dimethylbutyl)-2-(trichloromethyl)oxazolidin-5-
35 one (0.01 mol) and tetrahydrofuran (40 ml). To this
solution is added dropwise at room temperature a
solution of L-phenylalanine methyl ester (0.02 mol) in

5 tetrahydrofuran (20 ml). After the addition, the mixture is stirred at 40°C for 12 hours. After vacuo removal of solvents, the residue is treated with 20 ml water and dilute NaOH solution until the pH is 9. The product is then washed 2X with 20 ml diethyl ether. The water layer is adjusted to pH 2-3 with dilute hydrochloric acid. Then the mixture is cooled and filtered to isolate the neotame, which is washed with ice-water and dried.

10 EXAMPLE 5

N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine 1-methyl ester

15 L-phenylalanine methyl ester (0.02 mol) in tetrahydrofuran (20 ml) and NaOAc (0.04 mol) are loaded into a 100 ml flask. The mixture is stirred at room temperature for 15 minutes, and 4-carbomethoxy-3-N-(3,3-dimethylbutyl)-2-(trichloromethyl)oxazolidin-5-one (0.01 mol) is added. The mixture is stirred at 25°C for 23 hours and worked up using a procedure similar to Example 4 gives neotame.

25 EXAMPLE 6

25 2-[(4S)-3-(3,3-dimethylbutyl)-5-oxo-2,2-bis(trifluoromethyl)-1,3-oxazolan-4-yl]acetic acid

30 A gas flow of hexafluoroacetone is blown at a moderate rate at room temperature onto an intensely stirred suspension of 10 mmol of N-(3,3-dimethylbutyl)-L-aspartic acid in 20 ml 1,4-dioxane. A clear solution is formed overnight. The solvent was removed in vacuo, and the oily residue was confirmed to be an almost quantitative amount of 2-[(4S)-3-(3,3-dimethylbutyl)-5-oxo-2,2-bis(trifluoromethyl)-1,3-oxazolan-4-yl]acetic acid by NMR.

EXAMPLE 7

N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine
1-methyl ester

5 2-[(4S)-3-(3,3-dimethylbutyl)-5-oxo-2,2-
bis(trifluoromethyl)-1,3-oxazolan-4-yl]acetic acid (2
mmol) and L-phenylalanine 1-methyl ester (2 mmol) were
dissolved in tetrahydrofuran (15 ml). The mixture was
10 stirred at room temperature for 24 hours. The solvent
was removed in vacuo to yield an oil. A white solid,
confirmed to be neotame by NMR, was obtained after
stirring the oil in water overnight. Neotame was
obtained in 90% yield.

EXAMPLE 8

N-[N-(3,3-dimethylbutyl)-L- α -aspartyl]-L-phenylalanine
1-methyl ester

15 L-phenylalanine 1-methyl ester hydrochloride (10 mmol),
tetrahydrofuran (15 ml) and sodium acetate (NaOAc, 10
mmol) were loaded into a 50 ml flask. The mixture was
stirred at room temperature for 15 minutes. A solution
20 of 2-[(4S)-3-(3,3-dimethylbutyl)-5-oxo-2,2-
bis(trifluoromethyl)-1,3-oxazolan-4-yl]acetic acid (10
mmol) in tetrahydrofuran (10 ml) was added to the
mixture. The mixture was then stirred at room
25 temperature for 24 hours. The solvent was removed in
vacuo to yield a residue. The residue was stirred in
water overnight at room temperature. The precipitated
30 solid was filtered, washed with water and dried to
yield neotame in 90% yield.

15

10

15

Other variations and modifications of this invention will be obvious to those skilled in this art. This invention is not to be limited except as set forth in the following claims.
